Backend & Database

Role Distribution

How the Team Split the Work

- Frontend team built all UI pages across Milestones 1–4: authentication screens, dashboard, income & expense forms, budgeting, tax estimator, tax calendar, and financial reports.
- Backend & Database team designed the MySQL schema (Sequelize), built REST APIs, JWT authentication, and business logic for tax calculation and report generation.
- Collaborative implementation across modules, with cross-team integration and debugging throughout the project.

Problem Statement

Freelancers and gig workers juggle irregular income, scattered expenses, and unpredictable quarterly taxes — usually with no dedicated tool built for how they actually work.

Scattered Transactions

Income and expenses tracked across notebooks, spreadsheets, and bank apps with no single source of truth.

Unpredictable Tax Bills

No visibility into quarterly tax obligations until it is too late to plan for them.

No Budget Discipline

Without category-wise limits, overspending in one area goes unnoticed until month-end.

Filing-Time Chaos

Compiling reports for a CA or tax filing means digging through months of disorganized records.

Project Outcomes

01

Log Income & Expenses

Freelancers can record every transaction manually, with amount, category, date and notes.

02

Categorize & Budget

Transactions are grouped into categories with monthly spending limits and live progress tracking.

03

Regional Tax Estimates

Estimated tax is calculated automatically based on country, region, and filing status.

04

Financial Summaries

Monthly and quarterly income-vs-expense summaries surface trends at a glance.

05

Downloadable Reports

Reports export to PDF or CSV, ready to hand off for tax filing.

Modules Overview

Module A

Income & Expense Management

Core transaction logging engine — the foundation every other module builds on.

Module B

Categorization & Budgeting

Auto/manual categorization plus monthly budget limits with visual progress.

Module C

Tax Estimation Engine

Region-aware quarterly tax calculation with due-date scheduling.

Module D

Reporting & Export

Generates and exports financial summaries as downloadable PDF/CSV reports.

Technology Stack

FRONTEND

Angular (standalone components)

TypeScript, RxJS, HttpClient, Angular Router with route guards

BACKEND

Node.js + Express

RESTful APIs, middleware-based architecture, controller/service layers

DATABASE

MySQL

8 core tables: Users, Transactions, Budgets, Categories, Alerts, Tax Events, Tax Estimates, Reports

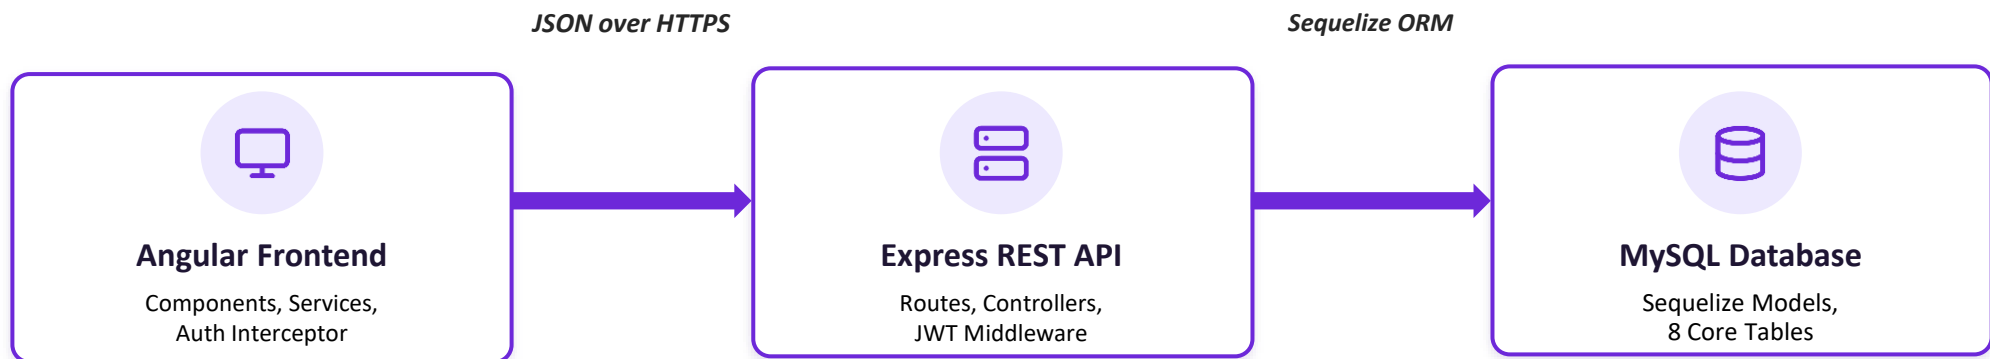

AUTHENTICATION

JWT (JSON Web Tokens)

Bearer token auth via HTTP interceptor, protected routes with authGuard

System Architecture

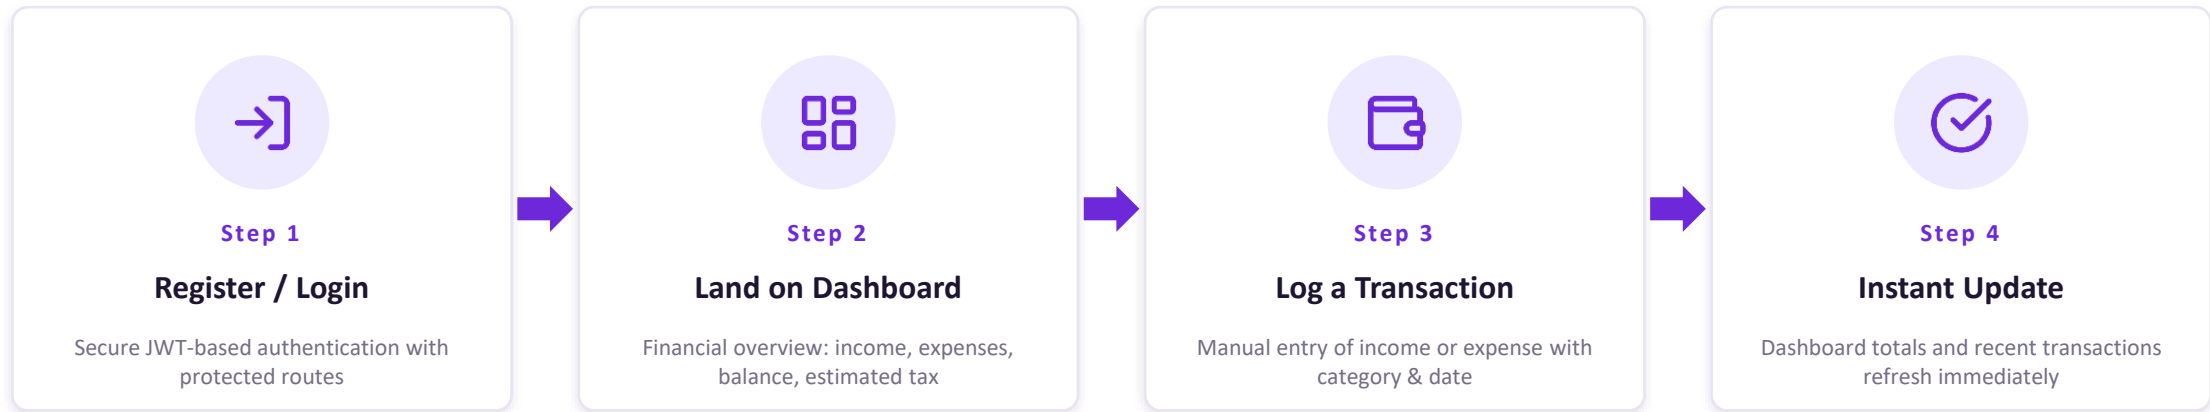

Request Lifecycle

Transaction Logging

Weeks 1–2 • Register/login system, manual income & expense entry, basic dashboard

MILESTONE OUTPUT

Working login/register screens, a live financial dashboard with income-vs-expense chart and expense breakdown, and functional income & expense input forms — all connected to the MySQL-backed Express API.

Reporting & Export

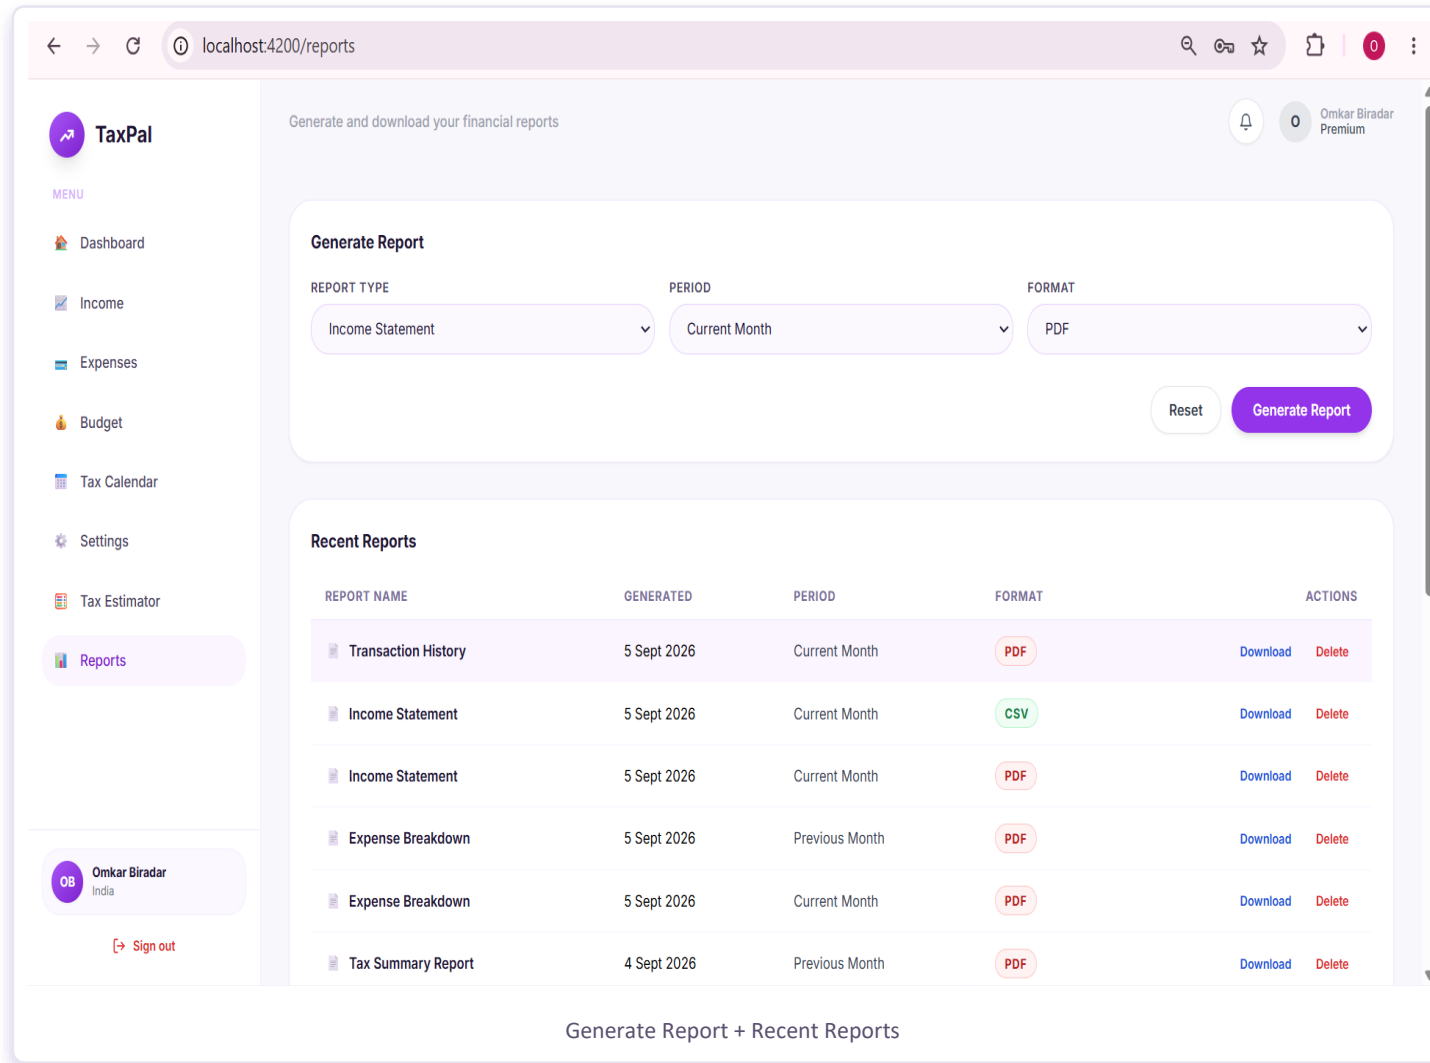

Weeks 7–8 • Generate & download summary reports, monthly/quarterly breakdowns, PDF/CSV export

TEAM WORK ON THIS MODULE

The team implemented report generation and export — report selection, period and format handling, API integration, recent reports, download/delete actions, and error handling.

Financial Reports Page

The screenshot displays the TaxPal Financial Reports page. The left sidebar contains a menu with options: Dashboard, Income, Expenses, Budget, Tax Calendar, Settings, Tax Estimator, and Reports (highlighted). The main content area is titled "Generate and download your financial reports" and includes a "Generate Report" section with dropdowns for Report Type (Income Statement), Period (Current Month), and Format (PDF), along with "Reset" and "Generate Report" buttons. Below this is a "Recent Reports" table listing various reports with their generation dates, periods, formats, and download/delete actions.

Generate and download your financial reports

Challenges & Debugging

Building a full-stack finance application required the team to coordinate UI, APIs, authentication and database operations. The main challenges were solved through structured testing, logging and end-to-end tracing.

Frontend–Backend Integration

Keeping request payloads, API responses and UI models aligned across components and services.

Authentication & Access

Protected APIs depend on valid JWTs and correct interceptor and guard behavior for every request.

Data Consistency

Ensuring values shown in the UI match the records returned from the backend and database.

Routing & Navigation

Unique, correctly configured routes are essential for reliable navigation between application screens.

HOW THE TEAM DEBUGGED

Reproduce

Trace

Isolate

Fix

Verify

Reproduce the issue → trace the request flow → isolate the root cause → apply the fix → verify the complete flow

Key Learnings

Full-stack ownership

Connecting UI, services, APIs and database operations gave the team a clearer view of the complete application request lifecycle

Router configuration matters

Verifying routes and API contracts early helps prevent integration issues and unexpected application behavior

Cross-team debugging

Tracing issues across frontend, backend and database layers strengthened systematic debugging and problem-solving.

Mock-to-real handoffs

Clear integration handoffs and consistent API contracts make collaboration smoother and simplify future maintenance

Thank You
